

Pocket Merchant

Includes Pocket Verifier Professional Software!

How it Works:

Your wireless PDA will establish a secure link over the Internet, and the information is sent via the most secure form of encrypted communication, and processed at our Payment Transaction Facility. Once authorized, the authorization code is sent to you, and the funds are transferred from the customer's credit card. Once each day (currently 10:30pm to midnight Pacific Time), the transactions made are 'settled' (an accumulation of all of your transactions for the day, minus any that you may have cancelled yourself), and the funds are transferred into your checking account. You will have access to these funds within 2 to 3 business days after the transaction.

One quarter the size of a traditional wireless credit card system, we have features the others can't match!

- User definable reference number or code.
- Keyboard Lock
- AVS for fraud detection on keyed transactions.
- Tip collection and management.
- On screen signature capture with transmission for storage on our transaction servers.
- Screen "flips" to present signature area to customer
- Fully encrypted transaction processing
- Compressed (paper saver) or standard size print options.
- Comprehensive transaction database with our exclusive Transaction Manager.

Cabled and Bluetooth Systems:

Pocket Merchant is our cabled system, we also have an optional Bluetooth card reader and printer. Some PDA's can use either, which gives you a choice, some can only use one or the other. You can look at the chart on the

right to see which version of the Printer/Reader combination you need. Pocket Verifier Professional supports a wide variety of Smartphones, using the Palm Operating System, Windows Mobile, Windows Smartphone, Select Blackberry devices, and Sony Ericsson P900/910. Pocket Verifier gives you the choice of carriers to ensure you have the wireless coverage you need, anywhere you go!

Pocket Merchant gives you the reliability of a cabled connection, freeing you from any interference problems in high-traffic environments like convention centers!
